

Activity: ransomware ANALYSIS

Ransomware is a type of malicious software that locks users out of their system or data using different methods to force them to pay a ransom. Most often, such programs encrypt files on an infected machine and demand a fee to be paid in exchange for the decryption key. Additionally, such programs can be used to steal sensitive information from the compromised computer and even conduct DDoS attacks against affected organizations to pressure them into paying

Activity

Look at the following pages about ransomware issues.

Identify the type of ransomware

<https://id-ransomware.malwarehunterteam.com/>

Ask: How many types of ransomware can be detected?

Clean (decryption) of files affected.

<https://www.nomoreransom.org/es/index.html>

Prevent ransomware attacks (with a built in Honeypot)

Look for more information about ransomware analysis (English pages only)

And comment this pages.

Now, Solve Some Challenges:

Our organization's antivirus has detected ransomware on a computer and has stopped it. In the antivirus report, among other things, the MD5 hash corresponding to the malware appears: 07fadb006486953439ce0092651fd7a6

Indicate the name of the ransomware family responsible for the incident.

If we have been victims of a ransomware attack, the first step is to identify the family to which said malware belongs. Once identified, it is possible to carry out a search on the details and behavior of said harmful code, being able to obtain valuable

information, such as knowing whether or not a file decryption and recovery tool exists.

The attached file, "info.zip", includes the ransom note created by ransomware after infecting a computer, along with one of the encrypted files.

You must identify the name of the malware

Depending on the ransomware family, it is possible to recover the encrypted data using a tool. Unfortunately, in most cases this is not possible and the only possible solution is to restore the computer from a backup.

Indicate which of the following ransomware families does NOT have a tool for file decryption:

Avaddon	Babuk	Bitcryptor
Coinvault	Dharma	Eking
Hakbit	Hive	Jigsaw
Lortok	Nemucod	Pylocky
Ragnarok	Sodinokibi	

Depending on the ransomware family, it is possible to recover the encrypted data using a tool.

The attached file "info2.zip" includes the ransomware ransom note along with an encrypted file after the infection of a computer. You must decrypt the encrypted file.

Document the entire process in pdf format. Sign it with your digital certificate.
