

Activity: 2FA

In this activity we will activate a 2FA two-factor authentication and use it to access the proxmox node

In this activity we will configure a proxmox node so that access is using a 2FA mechanism based on TOTP. For this we will need a working proxmox node.

VirtualBox will be used

We will install a proxmox ve node (latest version) just for the purpose of testing this authentication mechanism

Log in as root to the proxmox node, using a browser on a machine on the same network.

Create a user called user1, with a password

Log in with the user and check the mechanism used for access

Log out and log in with root

Previously, install the FreeOTP APP on a mobile device with which the 2FA will be carried out

Add TOTP-based 2FA. You will need the APP at that time.

Exit root and log in as user1.

Observe the TOTP mechanism

Document the entire process in pdf format. Sign it with your digital certificate.
