

Activity: Yubikey

In this activity we will activate a hardware token authentication and use it to access the SO session.

Yubico is a founding member of the FIDO (Fast IDentity Online) Alliance. The FIDO Alliance develops a set of open, interchangeable protocols that allow replacing the use of passwords to securely authenticate users of online services.

In this activity you must....

Configure and test access to the Windows Operating System with a yubico device.

Configure and test access to the Linux Operating System with a yubico device.

Configure and test access to google account (chrome navigator) with a yubico device.

Configure and test access to Hard Disk information with a yubico device.

Configure and test access to a Keychain Application (e.g. lastpass) with a yubico device.

Investigate how it can be done and then put it into practice.

Document the entire process in pdf format. Sign it with your digital certificate.
